

# The Prime-Spectral Framework: A Rigorous Reconstruction

The mathematics of the primon gas elevated to theorem grade: the self-adjoint primon Hamiltonian with simple spectrum  $\hbar\omega_0 \log n$ , the partition function  $\zeta(\beta\hbar\omega_0)$ , the Hagedorn temperature, the exact counting law, the Page–Wootters zeta clock, and the repaired arithmetic entanglement—bridging the gaps of the original framework and demoting every unproven claim to a falsifiable twelve-entry conjecture register.
